

STYLAGE®

Stylage® Launches In South Africa

Stylage®, the world's fastest growing dermal filler, has been launched into the South African market through Medical Aesthetic Group's South African subsidiary under the medical direction of Dr Stern Pretorius based in Cape Town.

Launched in 2008, Stylage® by Vivacy is now the second leading hyaluronic acid filler in France and a leading brand in Europe. The patented IPN-Like technology that combines cross linked hyaluronic acid with the benefits of Mannitol and Sorbitol anti-oxidants, has demonstrated its performance, reliability and durability in several published clinical studies and scientific papers.

All hyaluronic acid fillers are cross-linked with a chemical to resist natural degradation and prolong duration. However, Stylage® is also the subject of a patented manufacture process (IPN-Like Technology) that offers an extraordinary capacity of modeling with natural longer-lasting results. Its 3D structure has been created to remain stable to degradation with less cross

linking, therefore requiring less chemical interference. Stylage® claims the lowest levels of BDDE, the cross-linking agent.

Stylage® boasts a 12-18 month duration with minimal swelling for most of the range, including the mid-range medium viscosity products. Normally higher duration can be achieved only with increased viscosity. Stylage® can be used to fill and smooth wrinkles, natural lip correction, volume restoration, hydration, chin remodelling, tear trough correction, neck, décolleté & hand rejuvenation.

Dr Pretorius says “ We can safely say that all HA fillers are perfect tools for the job, but Stylage® has the added benefit of shortened recovery time and increased duration of results.”
